- What are behaviour change interventions and how do we currently design and study them?
- What is complexity?
- Why use complexity lens for <u>intervention development</u>?
- Why use complexity lens for <u>evaluation</u>?
- Note: <u>Various</u> systems: The complex system we are looking at can be the individual, the group, the intervention, the community, etc...

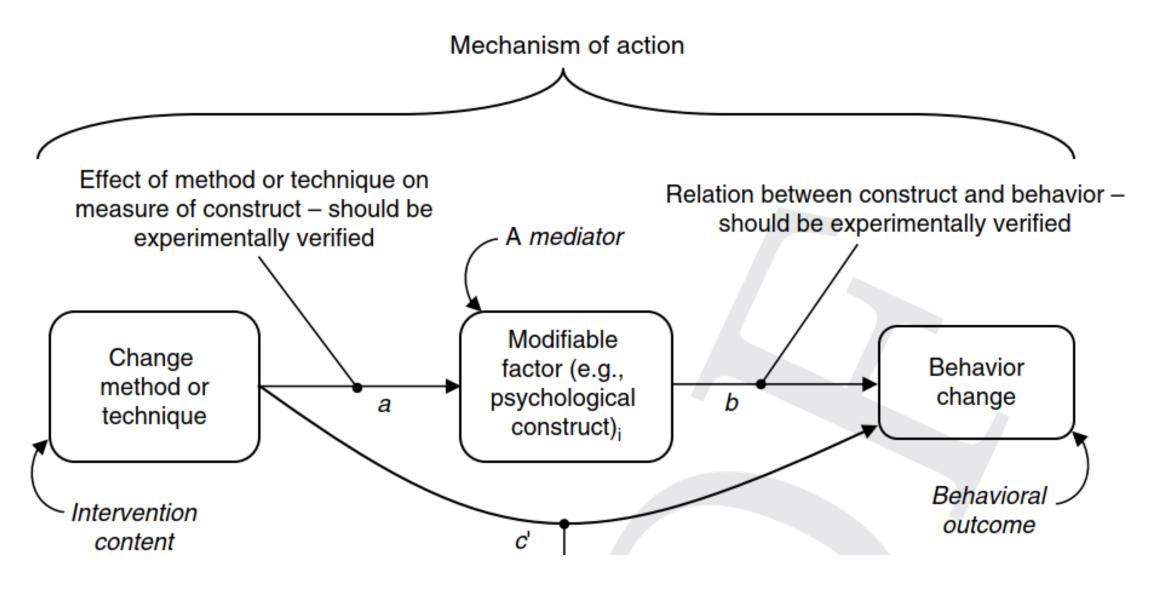

Behaviour change interventions

- Aims to change the behaviour of a population or group, by targeting particular behaviour(s), in order to solve a problem (e.g., prevention of illness, environmental protection)
- Examples:
 - One-on-one counseling
 - Programs at school, workplace, health care, etc.
 - Educational / persuasive media campaigns
 - Environmental/social planning (e.g. design of parks/buildings)
 - Regulation (e.g. fines)
 - Fiscal measures (e.g. taxation)

Abstract

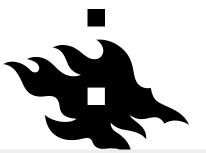

Background CONSORT guidelines call for precise reporting of behavior change interventions: we need rigorous methods of characterizing active content of interventions with precision and specificity.

according to similarity of active ingredients in an opensort task. Inter-rater agreement amongst six researchers coding 85 intervention descriptions by BCTs was assessed.

Results This resulted in 93 BCTs clustered into 16 groups.

Conceptual Review

A meta-analysis of techniques to promote motivation for health behaviour change from a self-determination theory perspective

Fiona B. Gillison 🔽 🗓, Peter Rouse, Martyn Standage, Simon J. Sebire & Richard M. Ryan using items from the Cochrane risk of bias tool. 2496 articles were identified of which 74 met inclusion criteria; 80% were RCTs or cluster RCTs. Techniques to promote need supportive environments were coded according to two established taxonomies (BCTv1 and MIT), and 21 SDTspecific techniques, and grouped into 18 SDT based strategies. Weighted mean effect sizes were computed using a random effects model; perceived autonomy support g = 0.84, autonomy g = 0.81, competence g = 0.63, relatedness g = 0.28, and motivation g = 0.41. One-to-one interventions resulted in greater competence satisfaction than group-based (g = 0.96 vs. 0.28), and competence satisfaction was greater for adults (g = 0.95) than children (g = 0.11). Meta-regression analysis showed that individual strategies had limited independent impact on outcomes, endorsing the suggestion that a need supportive environment requires the combination of multiple co-acting techniques.

Context

- Contextual factors which shape theories of how the intervention works
- Contextual factors which affect (and may be affected by) implementation, intervention mechanisms and outcomes
- Causal mechanisms present within the context which act to sustain the status quo, or enhance effects

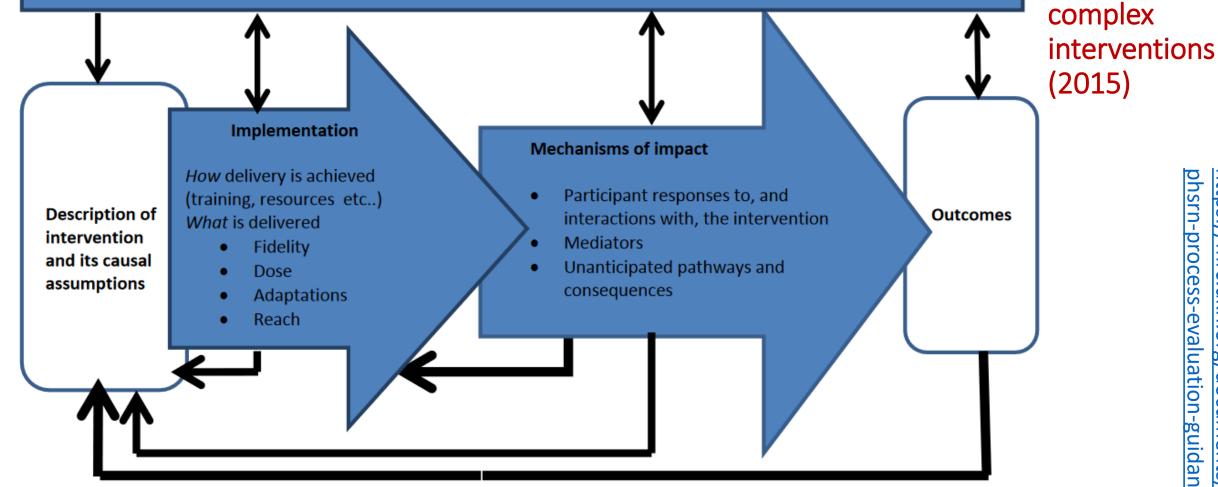

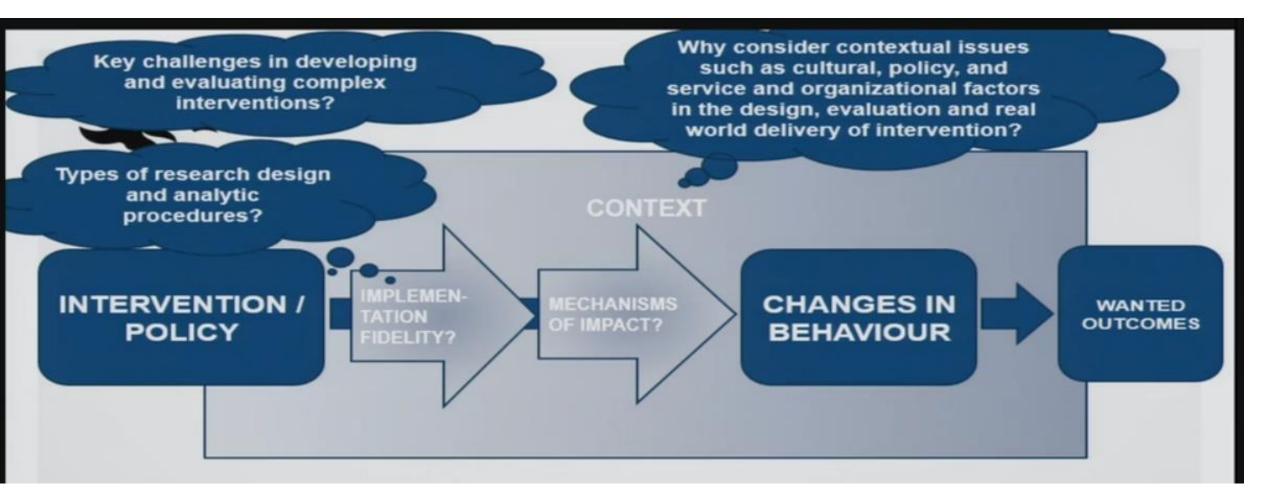

Figure 1. Key functions of process evaluation and relationships amongst them. Blue boxes represent components of process evaluation, which are informed by the causal assumptions of the intervention, and inform the interpretation of outcomes.

A chaotic view of behavior change: a quantum leap for health promotion

Ken Resnicow^{*1} and Roger Vaughan²

attempts, a person succeeds at increasing their physical activity, eating healthier or losing weight? Or, why after years of success a person relapses?

"health behavior change - - is conceptualized as a linear, deterministic process where individuals weigh pros and cons, and at the point at which the benefits outweigh the cost change occurs. Consistent with this paradigm, the associated statistical models have almost exclusively assumed a linear relationship between psychosocial predictors and behavior. Such a perspective however, fails to account for non-linear, quantum influences on human thought and action."

Abstract

Public health research and practice have been guided by a cognitive, rational paradigm where inputs produce linear, predictable changes in outputs. However, the conceptual and statistical assumptions underlying this paradigm may be flawed. In particular, this perspective does not adequately account for nonlinear and quantum influences on human behavior. We propose that health behavior change is better understood through the lens of chaos theory and complex adaptive systems. Key relevant principles include that behavior change (1) is often a quantum event; (2) can resemble a chaotic process that is sensitive to initial conditions, highly variable, and difficult to predict; and (3) occurs within a complex adaptive system with multiple components, where results are onen greater than the sum of their parts.

We have been studying complex interventions,.... Haven't we...?

Developing and evaluating complex interventions: (2006)

But: "Intervention characteristics are only one aspect of complexity"

Box 2 What makes an intervention complex?

Some dimensions of complexity

- Number of and interactions between components within the experimental and control interventions
- Number and difficulty of behaviours required by those delivering or receiving the intervention
- Number of groups or organisational levels targeted by the intervention
- Number and variability of outcomes
- Degree of flexibility or tailoring of the intervention permitted

Why use complexity lens for intervention development?

INTERVENTION DEVELOPMENT FRAMEWORKS

Key Tasks in Intervention Development

• Task 1. What is the problem to be addressed?

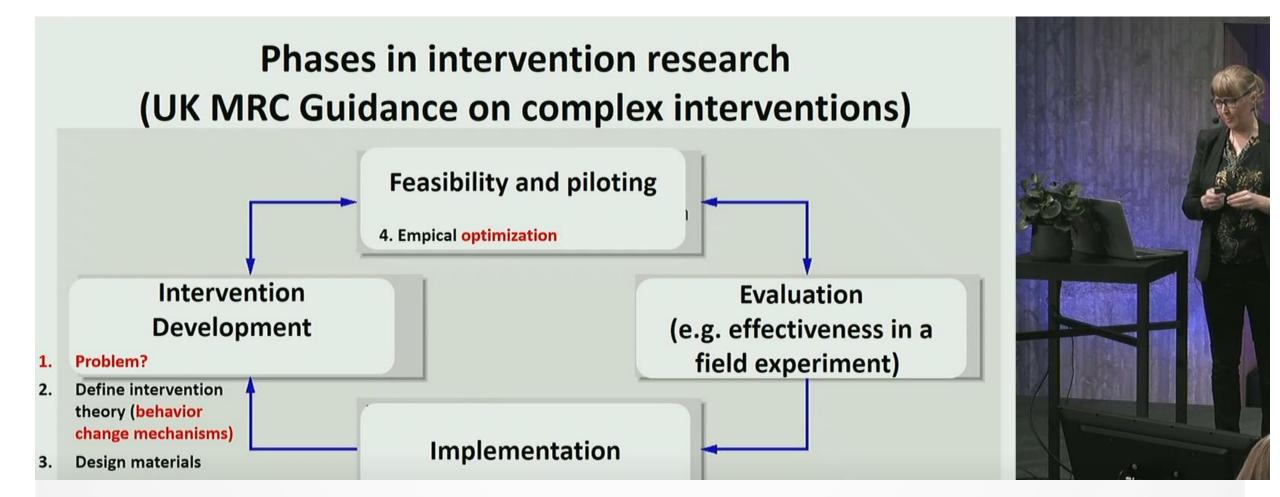

- Analyze the problem in behavioral terms
- · Develop a preliminary logic model or program theory
- Assess needs and resources
- · Consider systems of behaviors and ecological system
- Define the target behavior(s)

HELSINGIN YLIOPISTO

UNIVERSITY OF HELSINKI

- Task 2: What are the hypothesized mechanisms of effect and intervention components?
 - Understand the target behavior(s) informed by theory and evidence
 - Select key modifiable determinants to be targeted
 - Define and develop intervention content and delivery modes
 - Bringing it all together: A well-defined logic model or program theory
- Task 3. Development of intervention materials and technology
- Task 4. Empirical optimization of the intervention

Make use of appropriate <u>formal</u> theories!

Nelli Hankonen (2nd BeSP): Common tasks and principles in behaviour change intervention development frameworks: Integrative review

UNIVERSITY OF HELSINKI

RECENT CALLS...

- Currently, program theories typically assume causal pathways with separate components, usually hypothesized to be linearly associated
- But: Individuals, organizations and behavior, which are the targets of interventions, AND the interventions themselves are complex, adaptive and dynamic systems (see e.g. Gomersall 2018, Resnicow & Page, 2008)
- There are limitations of approaches to interventions which use reductionistic 'engineering' (e.g. Hawe, 2015)
- \rightarrow consider interventions (and behavior change) as complex systems!
-→ focus on the relationships and interconnections between different parts or components, rather than on individual parts separately

Hankonen & Hardeman 2020: Developing behaviour change Interventions. Nelli Hankonen Handbook of Behaviour Change

COMPLICATED VS. COMPLEX INTERVENTIONS

 Complicated interventions may involve numerous interacting components, but still can be divided into discrete sets of actions with predictable, stable and linear consequences

Thus, **intervention program theories** & ensuing **evaluations** should take such aspects into account (Rogers, 2008)

E.g.

recursive causality (with reinforcing loops)
disproportionate, non-linear relationships ('tipping points')

```
•emergent outcomes
```

- Complex interventions: <u>emergent</u>, <u>unpredictable</u>, and <u>non-linear nature</u> <u>of associations</u> between actions and outcomes.
 - Many behavior change interventions!!
 - Humans are active agents, whose behavior continuously adapts in response to feedback from one another, and individual's behaviors are part of broader small group and community systems (Moore et al. 2019)

Moore et al., 2019, Hawe et al. 2009, Rogers, 2008, Hagger, Cameron, Hamilton, Hankonen, Lintunen, 2020

23

Rogers: Using Programme Theory to Evaluate

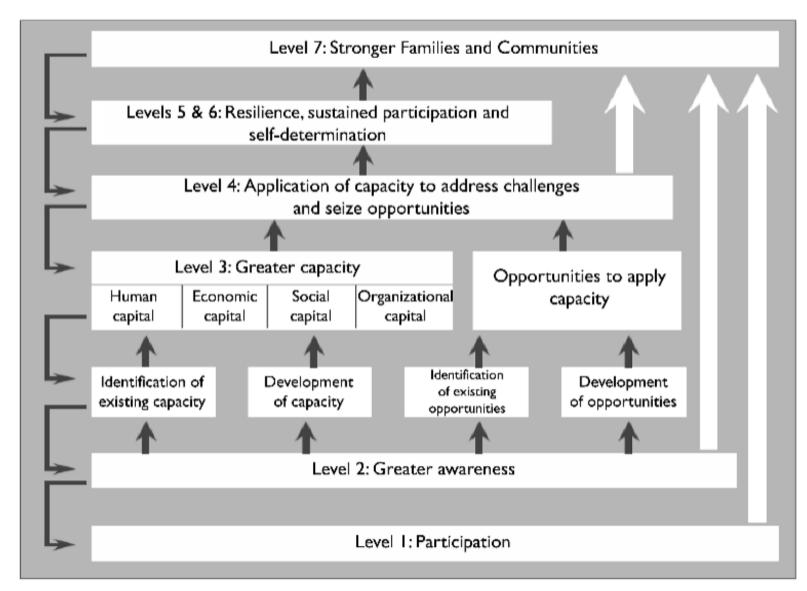

Figure 5. Logic Model for a Complex, Complicated Intervention: Community Capacity-Building Programme (CIRCLE, 2006)

HELSINGIN YLIOPISTO HELSINGFORS UNIVERSITET UNIVERSITY OF HELSINKI

Nelli Hankonen

• Behaviour change is COMPLICATED vs. COMPLEX?

Aspect of complexity	Simple intervention	Complex intervention
 Recursive causality and disproportionate effect 	Linear, constant dose– response relationship	Recursive, with feedback loops, including reinforcing loops; disproportionate effects at critical limits
2. Emergent outcomes	Pre-identified outcomes	Emergent outcomes

• Of course, partially we are "prisoners" of current theories

Example of indoor air pollution system in Nairobi

DO COMPLEXITY FEATURES IMPROVE EFFICACY?

If the intervention acknowledge the dynamic, adaptive nature of human behavior and contexts – evolving and co-evolving nature of systems – does it improve effectiveness?

Leykum et al 2007 studied four CS characteristics:

- Learning: People are active agents who process information and react to changes therein
- Interconnections in the system, e.g. new connections between agents in the system
- <u>Self-organization</u> (e.g., order is created in a system without explicit hierarchical direction)
- **<u>Co-evolution</u>** (the system and the environment influence each other's development).

Implementation Science

Research article

Organizational interventions employing principles of complexity science have improved outcomes for patients with Type II diabetes Luci K Leykum^{*1}, Jacqueline Pugh¹, Valerie Lawrence¹, Michael Parchman², Polly H Noël¹, John Cornell¹ and Reuben R McDaniel Jr³

Intervention	Characteristics Present	Score Given
I-page reminder of BP goals put on the front of the charts of all diabetics	None	0
Educational materials (articles, videotapes) sent to physicians at defined intervals	Learning	I
Decision – support system generated treatment recommendations based on current treatment and level of control. Patients seen monthly until controlled.	Interconnections Co-evolution	2
Pharmaco-evaluation and med review conducted at set intervals over 1 year. Emphasis on education, but tailored to progress of individual patients	Learning Interconnections Co-evolution	3
Usual visits replaced with group visits led by a physician and diabetes nurse educator, who were allowed to tailor the meeting frequency and content to the needs of the group. The goal of these visits was to improve compliance through education.	Learning Interconnections Self-Organization Co- evolution	4

Table 2: Examples of interventions utilizing characteristics of complex adaptive systems

- Although many interventions and policies have included CS principles, many intervention development *frameworks* have not explicitly drawn on these
- →CS views could be more explicitly integrated and adopted in intervention <u>development</u> <u>frameworks</u> and behavior change <u>theories</u>

I.e., not just as one of the formal theories used as a basis

- How to best harness, address, model, and plan for characteristics of dynamic complex systems in intervention development?
- Note: Not only conceptualizing the "outer" system, but also individuals, dyads, and groups etc. <u>as complex systems</u>

NOTE: MANY OF CURRENT INTERVENTIONS <u>DO</u> TAKE THIS INTO ACCOUNT!

- More and more intervention developers model behaviours in context and as parts of systems of competing/facilitating behaviours
- Developers and researchers DO acknowledge interventions are more complex than their linear logic models → often drawn in a simplified fashion for clarity & communication for stakeholders etc.
- Complex systems features are often included in the interventions, but not necessarily explicitly named as such / stemming from an explicit CS base
 - E.g., our Let's Move It intervention design was in line with several complexity features

– <u>Matti Heino's talk: https://www.youtube.com/watch?v=faZABqka-5Q&t=7025</u>

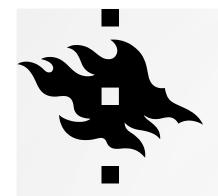

However, lots of missed opportunities...

MISSED OPPORTUNITIES OF CS FOR INTERVENTION DEVELOPMENT

- Behaviour change is **COMPLICATED** vs. **COMPLEX**?
- Possible problems & choices in intervention development:
 - Expecting determinant-BC relationships to be linear?
 - Deconstructing psych./BC processes to its component parts ("determinants"/influences) not modeling/making use of synergistic effects
 - Focusing on components and not their interconnections, not forging & strengthening interconnections more intentionally
 - Enough room for **self-organization and emergence**?
 - Pre-specified paths vs. co-evolution
- → Embrace complexity aspects in intervention program theories (Rogers, 2008)
- But we also need to renew our formal theories to account for the complexity

HELSINGIN YLIOPISTO HELSINGFORS UNIVERSITET UNIVERSITY OF HELSINKI

Why use complexity lens for <u>evaluation</u>?

- Limited utility of using randomised controlled designs to evaluate effects of complex interventions in complex systems
 - Recommended talk from 1st BeSP: Dr. Michael Sanders: Practical Science how we bring rigour into the evaluation of policy <u>https://vimeopro.com/user39826906/the-1st-besp-</u> <u>symposium/video/336145420</u>

Complexity

- The What Works Network has generally failed at embracing complexity
- Where we've run trials looking at complicated things, they've very often failed
- This means that the tail ends up wagging the dog we only evaluate that which is easy to evaluate
