

Helsinki Factorial

The Factorial citrate buffer pH gradient is dispensed with Factorial citrate pH 4 (stock solutions: 0.9 M Citric acid , 0.9 M BisTrisPropane pH 4) and Factorial citrate pH 10 (stock solutions: 0.9 M Sodium citrate, 0.9 M Bis TrisPropane)

The crystallisation conditions of this screen are divided into classes according to the main precipitant of the well. This helps in interpreting the results; by checking whether all the hits are in the same class of precipitant or whether hits are scored with different precipitants makes it easier to design new crystallisation trials. The classes are

1) Viscous organic precipitants; in grey and marked with the letter **V**

2) Non-viscous organic precipitants; in pink and marked with the letter **N**

3) Salt precipitants; in turquoise and marked with the letter **S**

Note: the concentration in parentheses is the stock solution concentration used to make the well solution
